

# webercem grout

# General-purpose, shrinkage compensated cementitious grout

- Flowable
- Suitable for stanchions and base plates
- Can be pumped, poured or trowelled

# About this product

webercem grout is a premixed, shrinkage compensated cementitious grout developed for applications where a cost-efficient grout with good flow and strength is required. webercem grout is designed primarily as a pourable grout but can also be used at a plastic consistency.

Complies with BS EN 1504-3 and BS EN 1504-6.

#### Features and benefits

- General purpose grout suitable for use over a temperature range of between 5°C and 25°C
- Can be pumped, poured or trowelled
- Good flow properties
- Can be applied in thicknesses ranging from 10 mm to 100 mm
- Factory blended to eliminate on-site errors
- Complies with BS EN 1504-3 and BS EN 1504-6

#### Uses

- Grouting under stanchions and baseplates
- General void filling, under paving, in rubble walls etc.
- Fixing ballustrades, starter bars and barriers
- Underpinning

DEPTH

BS EN 1504-3 and 6 AS AN R4 MORTAR

**INITIAL SET** 

TECHOLOGY

#### Constraints

**webercem grout** must only be used in confined situations, e.g. under baseplates, in holes etc.

# Preparation

All surfaces should be clean and sound. Concrete surfaces must be free from any contamination including oil, grease, laitance and dust - and for maximum bond the surface should be roughened and pre-soaked with clean water.

Immediately prior to grouting, remove surface water including that in bolt holes or recesses.

Metal surfaces must be free from rust, scale, oil or grease but removable metal shims should be lightly oiled.

Ensure bolt holes are free from dust, water or any loose material.

Formwork should be well sealed to prevent leakage.

#### Mixing

Mixing and placement can be carried out between +5°C and +25°C.

Mixing should be carried out in a proprietary grout mixer or by using a medium speed drill (650 rpm) with an MR4-type helical attachment.

Do not use more than the maximum stated water addition.

### Water addition

To obtain the consistency appropriate for a particular application use the water addition detailed below:

	Water addition (litres)	Approx. yield (litres)	
Pourable	3.0 - 3.4	14.0	
Flowable	3.8 - 4.25	14.5	

# **Application**

When pouring, the area to be grouted should be shuttered and a header box used to maintain a grout head of 150 - 200 mm during the pour.

Machine mixing is recommended to achieve continuous pouring. For large applications **webercem grout** should be placed by pump.

Continuous grout flow is essential and sufficient grout and water should be available to be mixed to ensure there is no disruption during placement.

Where the thickness of grout is greater than 100 mm, use **webercem advanced repair concrete**. This will impact the performance properties of the material and the user should satisfy themselves that the material is still fit for purpose.

Avoid leaving unconfined areas of grout proud around bearings etc.

The grout around the edges of baseplates must be finished flush with the sides by cutting the grout while still curing after stripping formwork.

Cracking may result in areas where there is no restraint.

# Cleaning

Clean all brushes and tools with water immediately after use.

### **Packaging**

**webercem grout** is supplied in 25 kg polythene lined bags.

#### Yield

See water addition.

#### Storage and shelf-life

When stored unopened in a dry place at temperatures above 5°C, shelf life is 12 months from date of manufacture. If stored longer, product performance may differ.

# Health and safety

For further information, please request the Safety Data Sheet for this product.
